

Prompt given in claude :

Act as a Senior Frontend Developer and UI/UX Designer. Develop a complete "Campus SnackPass" web application using only HTML, CSS, and JavaScript (no frameworks). The application should have a modern, attractive, and fully responsive design with clean, modular, and well-commented code. provide me all the features of this project one by one also dont provide me any code. add more advanced features to this proejct

Prompt given by claude :

Campus SnackPass — Full Feature Breakdown

Here's a complete feature roadmap for the app, organized by category so you can see the full scope before any code gets written.

1. Core User-Facing Features

Authentication & Profiles

- Student login/signup (roll number + college email validation)
- Profile with photo, hostel/department, wallet balance
- Guest/browse mode without login

Snack Store & Ordering

- Categorized menu (Snacks, Beverages, Meals, Combos)
- Search bar with live filtering/autocomplete
- Filters: price range, veg/non-veg, spicy, bestseller, available now
- Item detail view (image, description, calories, ratings)
- Add to cart with quantity stepper
- Cart summary with edit/remove
- Order scheduling (order now vs. pre-order for later slot)

Checkout & Payments

- Multiple payment simulation options (wallet, UPI mock, cash on pickup)
- Coupon/promo code system
- Order summary with tax/discount breakdown

- Digital token/QR code generated after order for pickup verification

Order Tracking

- Real-time order status (Placed → Preparing → Ready → Collected)
- Estimated pickup time countdown
- Order history with reorder button

2. Canteen/Vendor Side Features

- Vendor dashboard to manage menu items (add/edit/remove, mark sold-out)
- Incoming orders queue with accept/reject
- Daily sales summary panel
- Inventory low-stock alerts

3. Advanced/Standout Features (to make it portfolio-worthy)

- **Smart Queue Management** — shows live count of pending orders ahead of yours, so users know actual wait time instead of guessing
- **AI-style Recommendation Engine** — "Frequently bought together" and personalized suggestions based on order history (rule-based, no real ML needed)
- **Group Ordering** — split a combo order among friends, each pays their share via shareable link
- **Loyalty & Rewards System** — points per order, redeemable for free items, streak-based badges ("5-day snack streak")
- **Dark/Light Theme Toggle** with saved preference
- **Offline-first PWA support** — installable app icon, cached menu for poor campus Wi-Fi zones
- **Push-style Notifications** (in-app toast/banner) — "Your order is ready for pickup!"
- **Voice Search** for menu items (Web Speech API)
- **Nutrition & Allergy Filter** — hide items with allergens user has flagged in profile
- **Canteen Crowd Heatmap** — visual indicator (Low/Medium/High rush) per canteen location
- **Multi-canteen Support** — switch between different campus food courts, each with its own menu
- **Analytics Dashboard for Vendors** — charts for top-selling items, peak hours (using Canvas/SVG, no chart library needed if you want pure vanilla)

- **Accessibility Mode** — larger text, high-contrast toggle, keyboard-only navigation support
- **Emergency "Skip the Line" Pass** — limited-use priority tokens for students with back-to-back classes
- **Feedback & Rating System** with photo upload for order quality
- **Admin Panel** — manage vendors, view platform-wide order volume, ban/suspend accounts

4. Technical/UX Polish Features

- Skeleton loading screens instead of blank states
- Micro-interactions (button ripple, cart bounce animation, confetti on order success)
- Toast notification system (success/error/info)
- Responsive breakpoints for mobile, tablet, desktop
- LocalStorage-based persistence (cart, theme, login session) since no backend
- Modular JS architecture (separate modules for cart, auth, menu, orders)
- Empty states with illustrations (empty cart, no orders yet)
- Form validation with inline error messages

I have given this prompt in git copilot to provide html , css , java script.
